

Halides group

The Halides are a group of minerals whose principle anions are halogens. Halogens are a special group of elements that usually have a charge of negative one when chemically combined.

The halogens that are found commonly in nature include Fluorine, Chlorine, Iodine and Bromine. Halides tend to have rather simply ordered structures and therefore a high degree of symmetry. The most famous halide mineral, halite (NaCl) or rock salt has the highest symmetry $4/m\bar{3}2/m$. The colorful mineral fluorite (CaF₂) also has $4/m\bar{3}2/m$ symmetry and its cubic crystals are very popular mineral specimens. There are only a few common halide minerals. The typical halide mineral is soft, can be transparent, is generally not very dense, has good cleavage, and often has bright colors.

Sulfosalts

- There are approximately 100 species constituting the rather large and very diverse sulfosalt class of minerals. The sulfosalts differ notably from the sulfides and sulfarsenides with regard to the role of semimetals, such as arsenic (As) and antimony (Sb), in their structures. In the sulfarsenides, the semimetals substitute for some of the sulfur in the structure, while in the sulfosalts they are found instead in the metal site. For example, in the sulfarsenide arsenopyrite (FeAsS), the arsenic replaces sulfur in a marcasite- (FeS_2 -) type structure. In contrast, the sulfosalt enargite (Cu_3AsS_4) contains arsenic in the metal position, coordinated to four sulfur atoms. A sulfosalt such as Cu_3AsS_4 may also be thought of as a double sulfide, $3\text{Cu}_2\text{S} \cdot \text{As}_2\text{S}_5$.

Physical Properties of Fluorite

<i>Chemical Classification</i>	<i>Halide</i>
<i>Color</i>	<i>Typically purple, green, and yellow. Also colorless, blue, red, and black.</i>
<i>Streak</i>	<i>White</i>
<i>Luster</i>	<i>Vitreous</i>
<i>Diaphaneity</i>	<i>Transparent to translucent</i>
<i>Cleavage</i>	<i>Four directions of perfect cleavage</i>
<i>Mohs Hardness</i>	<i>4</i>
<i>Specific Gravity</i>	<i>3.2</i>
<i>Diagnostic Properties</i>	<i>Cleavage, hardness, specific gravity, color</i>
<i>Chemical Composition</i>	<i>CaF₂</i>
<i>Crystal System</i>	<i>Isometric(Cubic)</i>
<i>Uses</i>	<i>Numerous uses in the metallurgical, ceramics, and chemical industries. A source of fluorine, hydrofluoric acid, metallurgical flux. High-clarity pieces are used to make lenses for microscopes, telescopes, and cameras.</i>

Physical Properties of Halite

<i>Chemical Classification</i>	<i>Halide</i>
<i>Color</i>	<i>Colorless or white when pure; impurities produce any color but usually yellow, gray, black, brown, red</i>
<i>Streak</i>	<i>White</i>
<i>Luster</i>	<i>Vitreous</i>
<i>Diaphaneity</i>	<i>Transparent to translucent</i>
<i>Cleavage</i>	<i>Perfect, cubic, three directions at right angles</i>
<i>Mohs Hardness</i>	<i>2.5</i>
<i>Specific Gravity</i>	<i>2</i>
<i>Diagnostic Properties</i>	<i>Cleavage, solubility, salty taste (The taste test is discouraged. Some minerals are toxic or contaminated by other people tasting them.)</i>
<i>Chemical Composition</i>	<i>NaCl</i>
<i>Crystal System</i>	<i>Isometric</i>
<i>Uses</i>	<i>Winter road treatment, a source of sodium and chlorine for chemical processes, food preservation, seasoning</i>

Phosphate group

- *Naturally occurring inorganic salts of phosphoric acid, $H_3(PO_4)$. More than 200 species of phosphate minerals are recognized, and structurally they all have isolated (PO_4) tetrahedral units. Phosphates can be grouped as: (1) primary phosphates that have crystallized from a liquid; (2) secondary phosphates formed by the alteration of primary phosphates; and (3) fine-grained rock phosphates formed at low temperatures from phosphorus-bearing organic material, primarily underwater.*

Physical Properties of Apatite

Chemical Classification	Phosphate
Color	Green, brown, blue, yellow, violet, pink, colorless. Transparent specimens with excellent clarity and vivid color are used as gemstones.
Streak	White
Luster	Vitreous to subresinous
Diaphaneity	Transparent to translucent
Cleavage	Poor to indistinct
Mohs Hardness	5
Specific Gravity	3.1 to 3.3
Diagnostic Properties	Color, crystal form, and hardness. Brittle, often highly fractured. Can be scratched with a steel knife blade.
Chemical Composition	<p>A group of calcium phosphates.</p> <p>Fluorapatite: $\text{Ca}_5(\text{PO}_4)_3\text{F}$ Hydroxylapatite: $\text{Ca}_5(\text{PO}_4)_3(\text{OH})$ Chlorapatite: $\text{Ca}_5(\text{PO}_4)_3\text{Cl}$ Carbonate-rich apatite/francolite: $\text{Ca}_5(\text{PO}_4)_3(\text{CO}_3)(\text{F},\text{O})$</p>
Crystal System	Hexagonal
Uses	Fertilizer, phosphoric acid, hydrofluoric acid, gemstones, ore of rare earth elements, pigments, gemstone. Serves as a hardness of 5 on the Mohs Hardness Scale.

Carbonates group

- Carbonates
- In nature, carbon atoms join with oxygen to form the carbonate ion, CO_3 . These ions combine with metal cations to form carbonate minerals. These minerals are commonly formed in sedimentary and oxidizing environments.
- The carbonates fall into three groups: the **calcite** group, the **dolomite** group, and the **aragonite** group. The copper carbonate minerals, azurite and malachite, are the only important economic carbonates.

Physical Properties of Calcite

<i>Chemical Classification</i>	<i>Carbonate</i>
<i>Color</i>	<i>Usually white but also colorless, gray, red, green, blue, yellow, brown, orange</i>
<i>Streak</i>	<i>White</i>
<i>Luster</i>	<i>Vitreous</i>
<i>Diaphaneity</i>	<i>Transparent to translucent</i>
<i>Cleavage</i>	<i>Perfect, rhombohedral, three directions</i>
<i>Mohs Hardness</i>	<i>3</i>
<i>Specific Gravity</i>	<i>2.7</i>
<i>Diagnostic Properties</i>	<i>Rhombohedral cleavage, powdered form effervesces weakly in dilute HCl, curved crystal faces and frequent twinning</i>
<i>Chemical Composition</i>	<i>CaCO₃</i>
<i>Crystal System</i>	<i>Hexagonal</i>
<i>Uses</i>	<i>Acid neutralization, a low-hardness abrasive, soil conditioner, heated for the production of lime</i>

Physical Properties of Dolomite

<i>Chemical Classification</i>	<i>Carbonate</i>
<i>Color</i>	<i>Colorless, white, pink, green, gray, brown, black</i>
<i>Streak</i>	<i>White</i>
<i>Luster</i>	<i>Vitreous, pearly</i>
<i>Diaphaneity</i>	<i>Transparent to translucent</i>
<i>Cleavage</i>	<i>Perfect, rhombohedral, three directions</i>
<i>Mohs Hardness</i>	<i>3.5 to 4</i>
<i>Specific Gravity</i>	<i>2.8 to 2.9</i>
<i>Diagnostic Properties</i>	<i>Rhombohedral cleavage, powdered form effervesces weakly in dilute HCl, hardness</i>
<i>Chemical Composition</i>	<i>$\text{CaMg}(\text{CO}_3)_2$</i>
<i>Crystal System</i>	<i>Hexagonal</i>
<i>Uses</i>	<i>Construction aggregate, cement manufacture, dimension stone, calcined to produce lime, sometimes an oil and gas reservoir, a source of magnesia for the chemical industry, agricultural soil treatments, metallurgical flux</i>

Aragonite

Category	<i><u>Carbonate mineral</u></i>
<u>Formula</u> (repeating unit)	CaCO_3
<u>Crystal system</u>	<i><u>Orthorhombic</u></i>
Color	<i>White, red, yellow, orange, green, purple, grey, blue and brown</i>
<u>Cleavage</u>	<i>Distinct on {010}, imperfect {110} and {011}</i>
<u>Fracture</u>	<i>Subconchoidal</i>
<u>Tenacity</u>	<i>Brittle</i>
<u>Mohs scale hardness</u>	<i>3-4</i>
<u>Luster</u>	<i>Vitreous, resinous on fracture surfaces</i>
<u>Streak</u>	<i>White</i>
<u>Diaphaneity</u>	<i>Translucent to transparent</i>
<u>Specific gravity</u>	<i>2.90</i>

Physical Properties of Malachite

<i>Chemical Classification</i>	<i>Carbonate</i>
<i>Color</i>	<i>Green</i>
<i>Streak</i>	<i>Green</i>
<i>Luster</i>	<i>Rare crystals are vitreous to adamantine. Fibrous specimens are silky. Massive specimens are dull to earthy. Polishes to a very bright luster.</i>
<i>Diaphaneity</i>	<i>Most specimens are opaque. Crystals are translucent.</i>
<i>Cleavage</i>	<i>Perfect in one direction. Fair in a second direction.</i>
<i>Mohs Hardness</i>	<i>3.5 to 4.0</i>
<i>Specific Gravity</i>	<i>3.6 to 4.0</i>
<i>Diagnostic Properties</i>	<i>Green color, soft, effervesces with dilute HCl to produce a green liquid.</i>
<i>Chemical Composition</i>	<i>$\text{Cu}_2(\text{CO}_3)(\text{OH})_2$</i>
<i>Crystal System</i>	<i>Monoclinic</i>
<i>Uses</i>	<i>A minor ore of copper. Gemstones, small sculptures, pigment.</i>

Physical Properties of Azurite

<i>Category</i>	<i><u>Carbonate mineral</u></i>
<i>Formula</i>	<i>$Cu_3(CO_3)_2(OH)_2$</i>
<i>Crystal system</i>	<i><u>Monoclinic</u></i>
<i>Color</i>	<i>Azure-blue, dark to pale blue; pale blue in transmitted light</i>
<i>Fracture</i>	<i>Conchoidal</i>
<i>Tenacity</i>	<i>brittle</i>
<i>Mohs scale hardness</i>	<i>3.5 to 4</i>
<i>Luster</i>	<i>Vitreous</i>
<i>Streak</i>	<i>Light blue</i>
<i>Diaphaneity</i>	<i>Transparent to translucent</i>
<i>Specific gravity</i>	<i>3.773 (measured), 3.78 (calculated)</i>
